PROJECTS

GoDonate

GoDonate is a project which I've been working on with the colleague of mine. It focuses on crowdfunding, gathering goods, money or some other material things for those people in need. It was generally our first faculty project which we've worked on. Technologies that were used are .NET 6 for server-side with SQL as database, while the frontend side was done in Angular.

Temperature and humidity detection

Temperature and humidity detection was another faculty IOT project which I've worked on. It is supposed to track the temperature and humidity of the room, and turn the cooler on/off. It was an interesting experience, because apart from the HTML, CSS, JS client-side, I've worked with Firebase as a database storage for the first time.

Currently, I'm practicing and expanding my knowledge in .NET as I'm learning about some of its well-known patterns. I'm also planning of learning some mobile-development technologies, such as Flutter, because that's the field that is completely new to me. As I've already said, I'm willing to work, develop and expand my knowledge.
